NOTES:

- The MXST Delay on Break contactor is designed for applications that require electrical power to be maintained for a specific amount of time after the engine is shut off. The contactor is triggered by an "OFF" signal - usually from the ignition key - and then maintains power for a programmed amount of time before it turns OFF (open).
- Contactor has two coils. Both are used for pull-in. After approximately 75 milliseconds, one coil is electronically removed from the coil drive circuit. The remaining coil supplies low continuous hold power sufficient for the contactor to meet all of its specified performance specifications. This provides the lowest coil power possible without the use of PWM electronics that have been known to cause EMI emissions and/or crosstalk on system control power.
- The Bypass pin overrides the timing circuit and can be used in cases where an immediate opening of the contactor is required. The Bypass pin does not need to be connected if this function is not required.
- Caution: In Voltage Control Mode, Pin 1 is digital input - leave it open or pull it low. Pin 6 is digital output - leave it open only.
- Also available with I²C option that allows customer to program and control the time delay feature. Please contact GIGAVAC for more details.
